## **PROBLEM DEFINITION**

The Retail Store Management System is a system designed for managing i.e. for ordering, arranging and selling goods. They checks for the availability of goods in the store. If the stock of goods is less , retailer places order for goods. If the stock of goods is available then he will arrange goods for selling. The retailer then sales the goods directly to the customer.

The retailer prepares bill for goods purchased by the customer, he receives amount by credit or by cash from customer. The supplier supplies the goods to the store in the system.

The overall system is used to manage the goods in the store.

## **SCOPE:**

Scope of this project is to investigate and design a software solution which can facilitate both customer and salesperson in performing their daily tasks, improving efficiency, and helping them to be more productive.

It provides quick way of operation by capturing the manual process and automating them. It will help them to manage the bill details, financial data, and historical data and also in producing documents of different formats for different customers.

This system will help the salesperson to manage in fast billing. It will help to maintain the data of the purchased items. It also gives bill to the customers.
